

9 audited benchmark-arms; on the 7 where both units are defined, 5 patient-level intervals reach chance and 2 do not

- patient-level interval reaches chance or lies below it
- slice AUC = patient AUC
- drop from the line of agreement
- only one unit is defined (plotted in a gutter)
- patient-level interval lies wholly above chance

PI-CAI, case level: no slice index in that label file, so no slice-level reading exists; the value shown is its strongest zero-image baseline (metadata tree).

Duke Breast: patient-level AUC is undefined because 922 of 922 patients are positive.
